Clinical Support Report: Melanoma

Patient Information:

The patient presents with a lesion on the [insert location] with an area of 450712 pixels. The model confidence in

Diagnostic Reasoning:

Based on the provided information, the lesion's size and shape suggest a potential melanoma. However, the low

Differential Diagnosis:

Other possible skin lesions that could be considered in the differential diagnosis include:

- * Benign moles (e.g., seborrheic keratoses)
- * Vascular tumors (e.g., pyogenic granuloma)
- * Skin cancers other than melanoma (e.g., basal cell carcinoma, squamous cell carcinoma)

Management and Treatment:

Surgery is the mainstay of treatment for primary melanoma. The recommended lateral surgical excision margins

Next Steps:

1. **Biopsy:** A skin biopsy should be performed to confirm the diagnosis and assess the Breslow thickness.
2. **Dermoscopy:** Dermoscopy can help identify characteristic features of melanoma, such as irregular borders
3. **Follow-up:** Regular follow-up appointments with the patient are necessary to monitor for any changes in the

Important Notes:

- * This report is an AI-assisted opinion and should not be considered a definitive diagnosis.
- * The American Joint Committee on Cancer (AJCC) staging system should be used to determine the stage of me
- * Further testing, such as imaging studies (e.g., CT or PET-CT scans), may be necessary for patients with advan
